Claims: Miner's Queen #1 - #8

Location: Section 34, T4N, R5E, (W.M.)
Sections 3,4, T3N, R5E, (W.M.)

Survey for: R.A. McMahon, R.C. Scheetz, S.A. Fox, D.O. Curry,
H.C. Scheuffle - owners

Survey by: Middle Fork Copper Mines Inc.

Date of Survey: September - October, 1970

Personnel involved: G.Lord, L. Records, A.R. Grant, Consulting Geol.

Instruments used: Scintrex MF 2 flux gate magnetometer
Jollander magnetometer

Results: The purpose of the survey was to subject the entire claim block to magnetometer coverage and, more specifically, to relate the known areas of chalcopyrite - magnetite mineralization at the Miner's Queen Prospect to the total anomalous framework.

Over 4 line miles of magnetometer survey were run over the claim block. The known areas of magnetite mineralization at the Miner's Queen Prospect responded with a lower magnetic response indicating the possibility of reverse polarity in the magnetite. With this response, the stronger anomalies reflect as relative lows.

The magnetic work delineated a dominant E-W to N70E trending anomalous linear feature. The total length of this feature is 5300'. Widths vary from 50 to 150 feet. It is noteworthy that the Minor's Queen Prospect lies within this magnetic linear. The linear appears to lie close to the contact between the altered, fractured, pervasively mineralized rocks and the massive, less altered intrusive rock. The magnetic linear is considered to be a potentially important structure; one which justifies further exploration.
